

IN THE SPECIFICATION

Please amend the specification as follows:

Replace the paragraph on page 12, between lines 14-19 of the specification with the following:

*as complete*

The brightness enhancement can be controlled by the display load as a function of time. The display load is the relative number of cells (pixels) which is on in a picture. The enhancement factor of the extra amount of light in the window to be enhanced may be selected to be the reciprocal value of the display load. The display load may first be filtered to obtain an average value over time. The maximum amount of light in the window may be limited (for example, to 1000 units).
